1. Claims 1-19 are allowed.
2. The following is an examiner's statement of reasons for allowance: the device controls a thermostat trip point using a resistor-to-digital converter, the value of an external resistor is measured and converted to a digital code equivalent. The digital code drives a DAC (Digital-to-Analog Converter), which sets the trip point for the thermostat. The tolerance of the external resistor's does not contribute to the tolerance of the trip point. These features have not been shown in the prior art.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Rantanen discloses a compensation circuit and method cancels transmit digital-to-analog (DAC) gain variations in a wireless communication device. A transmit DAC produces an output current signal $I_{\text{sub.load}}$ load proportional to a reference current $I_{\text{sub.ref}}$ which is inversely proportional to a load resistance $R_{\text{sub.load}}$ whereby the DAC output current signal $I_{\text{sub.load}}$ inversely tracks changes in the load resistance due to manufacturing process and temperature to cancel gain variations. The load resistor $R_{\text{sub.load}}$ and reference resistor $R_{\text{sub.ref}}$ are preferably located on the same IC and made of the same material. The transmit DAC includes a current steering cell which

receives the reference current I.sub.ref to produce the output current signal I.sub.load in proportion of the reference current I.sub.ref.
